

*Product Note***Description**

The Lane Reverse Q (RQ) Pond Outlet provides the Design Engineer with the ability to draw the discharge from the best quality of water in the settling pond (the upper zone). In addition, by use of the unique Outlet Lever Arm, the discharge quantity is directly proportional to the inverse of the depth of the pond instead of being proportional to the depth. This allows the designer to delay the larger flows from the pond—until the majority of the other sources feeding downstream waterways
